

# From MOOCdb to MOOC Data Science Commons

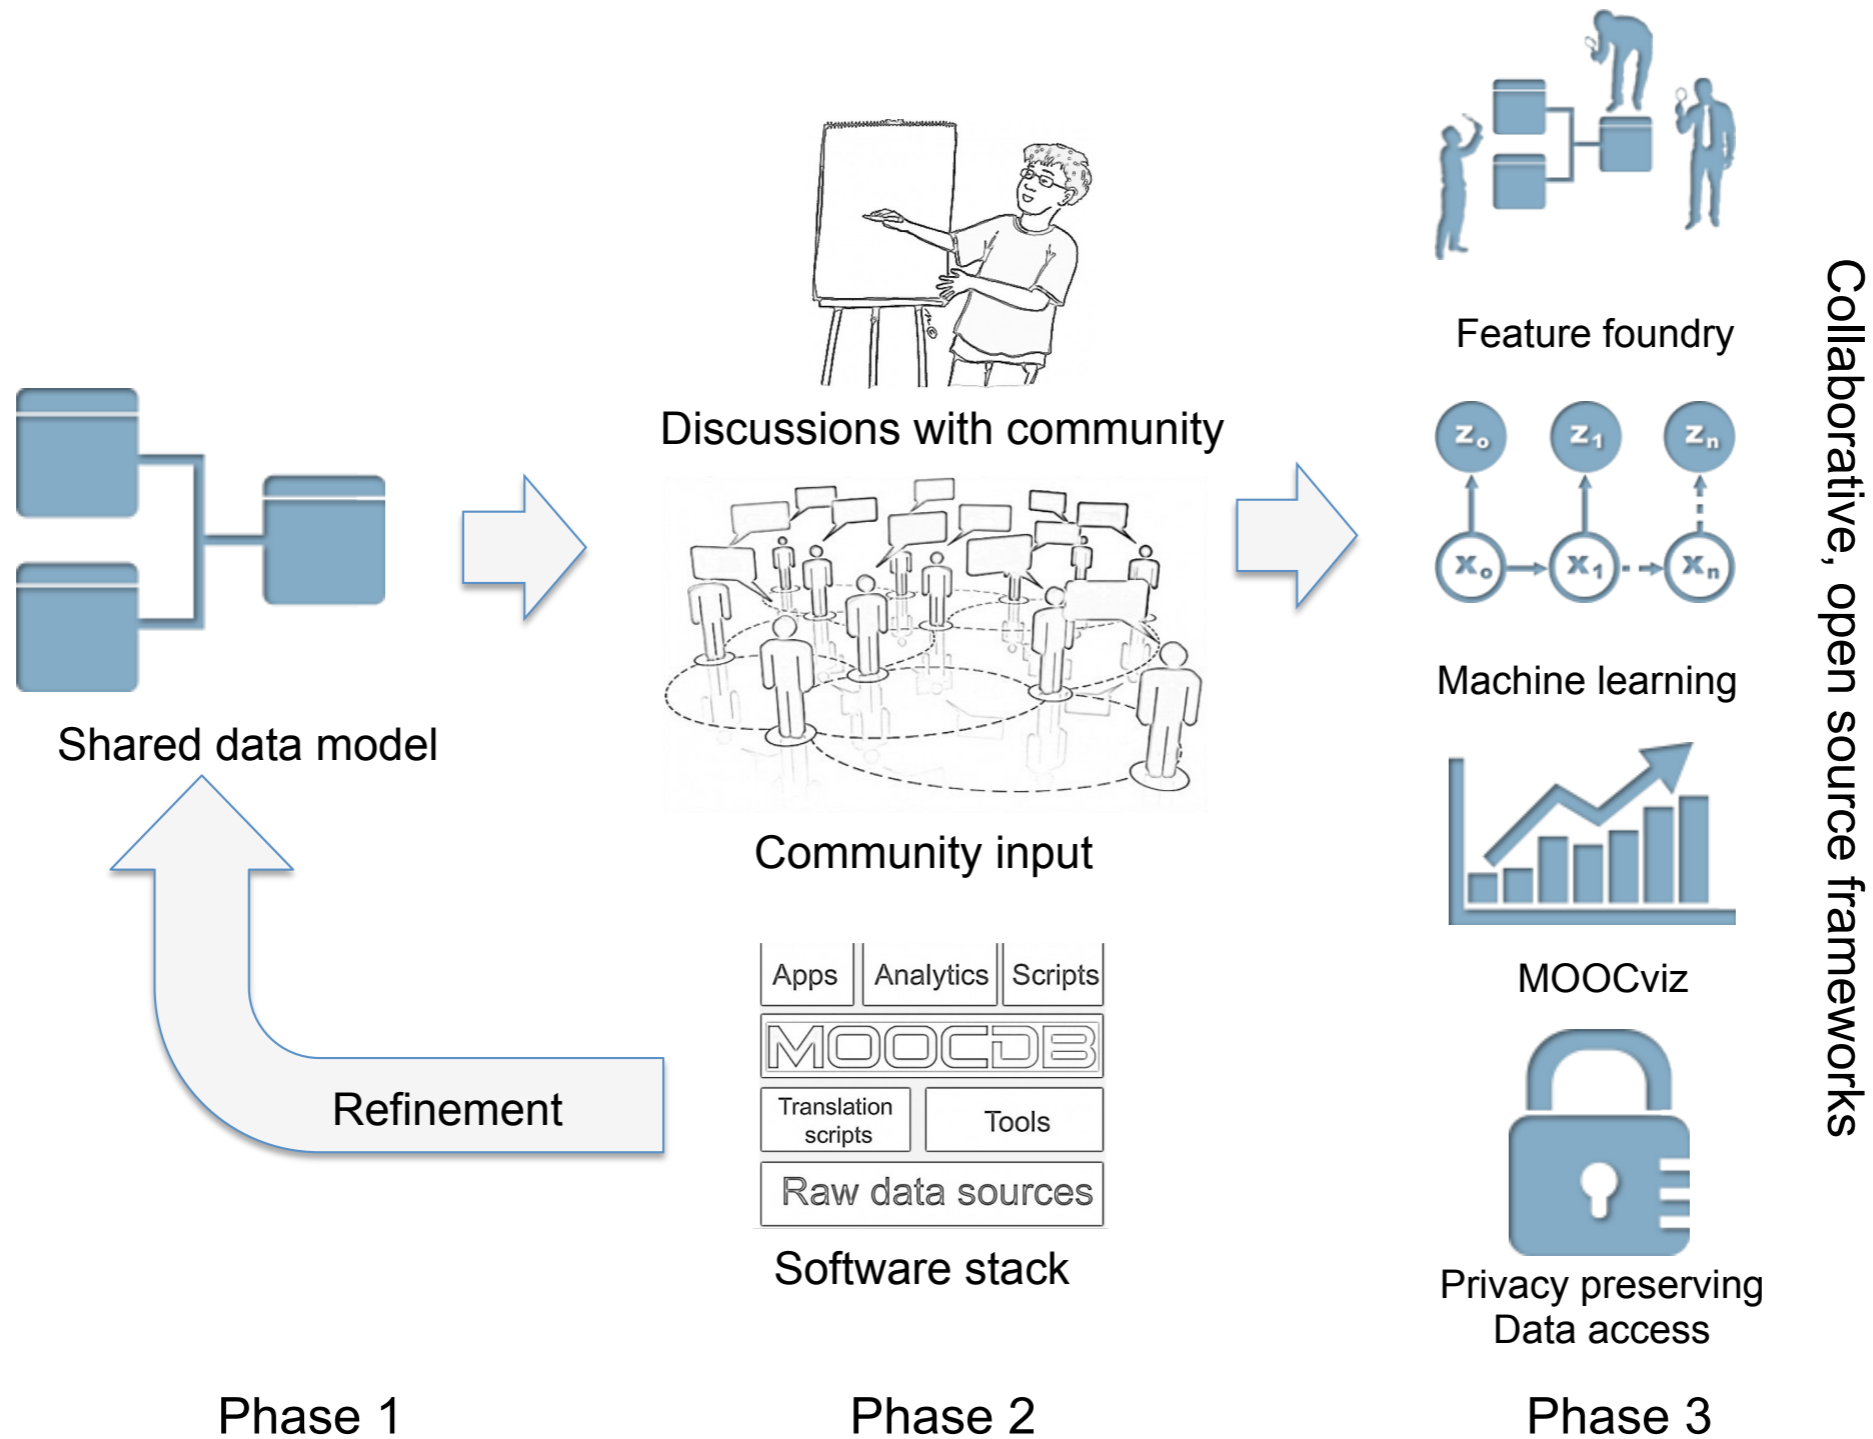

Goal: To build the largest shared repository of MOOC data science apps

Kalyan Veeramachaneni

# Where were we?

Circa. April 2014 (when we started to think about this proposal)

# Focus was on translating raw data to MOOCdb

# Current state of our resources?

Circa. January 2015

# Where are we today?

Circa. January 2015

> 100 course offerings  
67 Coursera courses  
30 edX courses  
5 OpenedX courses

Total number of events processed  
> 1 Billion

Total amount of data  
~2TB

Finished

In progress

# What is an app?

- An end-to-end packaged software chain with several value additions:
  - Integrated curation and processing tools
  - Appropriate and easy-to-use interfaces
  - Documentation (web based)
  - Use cases
  - Demonstration

# Types of apps

- Machine learning (ML) apps
- A machine learning app is designed to build a model of the data that solves a predictive, correlative and/or analysis problem.
  - end-to-end packaged software includes:
    - data preprocessing and curation
    - data assembly to make it ready for the machine learning approach
    - machine learning algorithm implementation
    - structured model output and storage
    - model analysis
    - visualization

# Types of apps

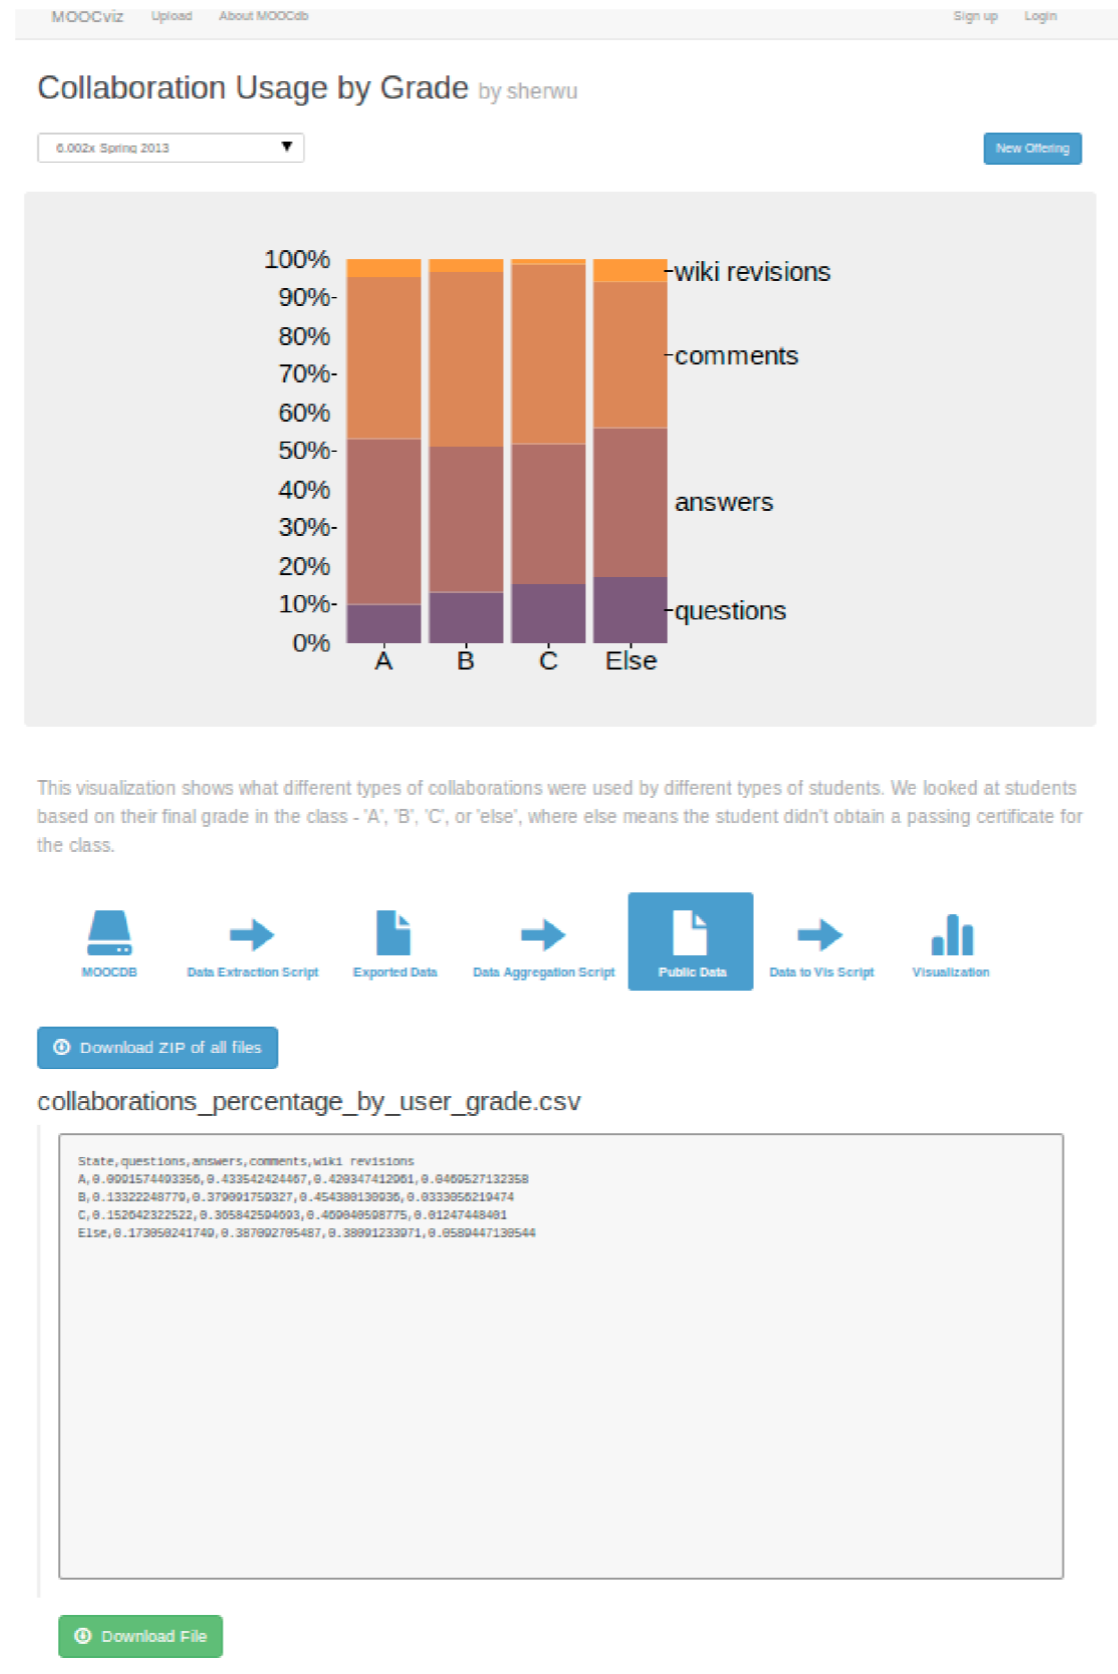

- Apps that are “Platforms”
- A “Platform” according to our definition is a web based system with which humans (analysts, instructors, data scientists, researchers) interact and it collects “human input and stores it in a persistent database” \*.
- Platforms enable us to solve endeavors that are human driven and are complimentary to automatic data processing, machine learning and analytic tools.
- They allow us to collaboratively work together and share our work through web based interfaces.
- Examples are: MOOCviz, Feature Factory, LabelMe-Text
  - An end-to-end packaged software includes:
    - data preprocessing and curation
    - data assembly to make it ready for the platform
    - user interfaces
    - backend database and storage design
    - analytics on the backend database
    - modules for platform administration

\* Ken’s suggested definition.

To read about our current design, please read [here](#) and [here](#) about MOOCviz development and [here](#) about our feature factory.

# An example platform app- MOOCviz

# Current apps

as listed on our website (some are in progress)

# How does an app come about?

- Starts with an idea and then:
  1. Refine the idea with input from multiple stakeholders
  2. Test it at MIT (use an MIT course data, if it is a data/machine learning app)
  3. Test it with external partners
  4. Generalize and refine
  5. Release (github source code, documentation)
- For a full release (finishing these steps 1-5), and development of an app it takes us 2 - 2.5 years
- Note that we build multiple apps simultaneously
- Some of the apps we showed today have been through Steps 1, 2 and 3 and some are at 2 and some are at 5.
