TheTEKSearchEngine

LibbyLevison,BillThies,SamanAmarasinghe MITLaboratoryforComputerScience libby@mit.edu,thies@mit.edu,saman@lcs.mit.edu

Abstract

TheInternethasthepotentialtodeliverinformationtoareasoftheworldthat havenoother informationresources.HightelephoneandISPfees -incombination with low band width connections -makeitunaffordableformanypeopletobrowsetheWebonline.Weare developing the TEK system to enable users to search the Webusing onlyemail.TEKstandsfor "TimeEqualsKnowledge,"sincetheuserexchangestime(waitingforemail)forknowledge (contained in the email). The system contains three components: 1) the client, which presents a graphicalinterfacetotheenduser,2)the server, which performs these arches from MIT, and 3) a reliableemail -basedcommunicationprotocolbetweentheclientandtheserver.TheTEKsearch enginediffersfromothersinthatitisdesignedtoreturnlow -bandwidthresults.whichare achievedbys pecialfiltering, analysis, and compression on the server side. We believe that TEK willbringWebresourcestopeoplewhootherwisewouldnotbeabletoaffordthem.

1.Introduction

Inmanyplaces in the world, there are no books, there are no librar ies, and there is limited access to information. In places that have both computers and functioning phone lines, the Internet has the potential to provide access to a large amount of information electronically. However, there are obstacles. Bandwidth is son arrow that it can take the user along time to find what she is looking for when brows ing the Web, since she has to wait for each page to be loaded. Moreover, times penton line translates to higher telephone and ISP charges, which quickly become prohibitive when baseline fees are 10% of a local wage. Finally, unreliable network infrastructures can sometimes prevent access to the Internet altogether.

Theseconditions are compounded by the fact that prominents earchenginess uch as Google and Alta Vista are designed for reliable, high -bandwidthenvironments. That is, they optimize for speed, assuming that a user can immediately runase cond, modified search if she is unhappy with the results of her first search. This tight feed back loop between the use rands earch engine is in appropriate for low -connectivity sites where the bottleneck is the time required to transfer the information, rather than the server's delay infinding the information. Also, mainstream search enginesselect pages without regard for their bandwidth requirements, acriterion which might be of primary interest to some one at the endofas low connection.

The TEK projectains to address these problems in several ways. We believe that if the results of an Internet search we remove af fordable, more reliable, and more information -rich, then people would be willing to wait a few days to see them. With TEK – which stands for "Time Equals Knowledge" – a user sends an Internet search viae mail to a server at MIT, which performs the search using existing search engines, download sactual pages and emails as ubset of

thosepagesbacktotheuser.Toavoidsendingthesamepagetoaclientasecondtime,the serverkeepstrackofallpagessenttoeachclient.Theserveralsoperformsspecial izedranking, filtering,andcompressionofthesearchresultstomakethemasbandwidth -friendlyaspossible. Additionally,thesystemincludesareliableemailprotocolandauser -friendlyinterface,which aredescribedbelow.

2.TheTEKSystem

Weh aveimplemented the basic functionality of the TEK system. There are three main components: 1) the TEK client, which provides a graphical user interface for constructing queries and viewing results, 2) the TEK server, which performs searches from MIT and sends the processed results back to the client, and 3) anemail -based communication protocol that manages the transfer of information over the unreliable connections between the client and the server.

Wewilldiscuss the end -to-endoperation of the system in the context of an example: a student who wants to search for information on **solar food dryer** s. The scenario might proceed as follows:

2.1. EnteringtheQuery

WeexpectthatthereisoneTEKclientmachineinaschoolortele -centerandthatitsuppor ts multipleusers.WhenthestudentstartsTEK,itappearsasasetoflocalwebpagesthatare viewedwithabrowser.Toplaceanewsearch,thestudentmustenterherusernameand password,afterwhichshecanalsoviewallofherprevioussearchresul ts.Thereisaspecial administratorinterfaceformanaginguseraccounts.

Proceeding with the query, the student enters the search terms, **solar food dryer**, in a web - based form resembling astandards earch engine. After the student confirms her search request, the query is placed under the student's "pending query" list and scheduled formailing. The student cannow log off — every thing else is done automatically by the system.

2.2. CommunicatingwiththeServer

Thenextstepisfortheclienttoemailthe querytotheserver.Thisprocesscanbeinitiated automaticallybytheTEKclient,perhapsinthemiddleofthenightwhenthetelephoneratesare cheapestandthereislessdemandforphonelines.However,sinceemaildeliveryisvery unreliableinsom epartsoftheworld,itisnotsufficienttojustsendtheemailandexpectittobe delivered.

Rather, the client and server follow a communication protocol that is designed to ensure reliable delivery of emails over unreliable connections (Prevost, 2 001). Generally speaking, the protocol works by keeping track of which messages have been sent, and which ones we rereplied to. If a reply is not received within a given time, then the protocol resends the original message.

2.3. ServerProcessing

When the server receives a search query, it retrieves a set of candidate pages by invoking existing search engines such as Google and Alta Vista. Because TEK is optimized for bandwidth, not response time, the server has the time to post - process the pages returned from the search engines. It does this by:

- **Filteringcontent.** Allduplicatepagesareremoved.Next,allimagesareremovedfrom thepagesunlesstheuserrequeststokeepthem,andallnon -essentialHTMLtags(suchas commentsandJavascript)aredele ted.Also,pagesthatareverysimilar(suchasmirror pagesfromdifferentsites)areeliminatedfromthecandidateset.
- Avoidingclient -sideredundancy. Theserverkeepstrackofwhichpageshavealready beensenttotheclientsoasnottowasteband widthbyresendingthesameversionofa page.IftheclienthasanoutdatedversionofagivenURL,thenanewversionissentto takeitsplace.
- **Clustering.** The candidate pages are grouped into clusters of similar pages; some pages from each cluster are sent to the client. For instance, in the case of the **solar fooddryer** query, the recould be clusters for pages relating to food to dry, usage of solar dryers and construction methods. Sending some pages from each cluster improves the likelihood that at least some of the informations entwill be relevant to the aspect of **solar food dryer** shat the student was most interested in.
- Identifyinghigh -informationpages. Anumberofheuristicsareappliedtodetermine whichpageshavethehighest"informati oncontent."Thesemetricsaredistinctfrom thoseusedbytoday'ssearchengines –forexample,wepreferpagesthathavekeywords appearinginparagraphtextinsteadoflinks,sinceinalow -connectivityenvironmentthe usercannotreadilyexplorethel inks.
- **Compressingtheresultset.** Alloftheresultsarecompressed into a zipfile before sending them back to the client, there by further reducing the bandwidth needed to download the results.

Followingtheserver'sprocessing,theresultsareemaile dtotheclientusingthecommunication protocoldescribedabove.

2.4. ViewingtheResults

When the results arrive on the client, the student needs to log into view them. The interface for viewing results is a special front page — constructed by the server — that organizes the pages by cluster and provides a link to each. The user can then browse through the pages as if they were being retrieved from on line.

Anadded feature of the TEK client is that it accumulates the information from each search into a local digital reference library. This library serves a saminiature, off line version of the Web,

allowinguserstofollowlinksfrompagetopageaslongasthereferencedpageswerealready downloadedduringaprecedingsearch.Theuserinterfaceprovide salocalsearchutilitysothat theusercansearchthecollectionoflocalpages.Onlywhentheinformationisnotfoundlocally isitnecessarytosendaquerytotheTEKserver.Inotherwords,ifanotheruserhadpreviously searchedforthesameinf ormation,anInternetsearchcanbeavoided.

3.Rationale

InthissectionwearguethattheTEKsystemwillmakeInternetaccesscheaper,morerobust, and,insomerespects,evenmoreconvenientforusersinlow -connectivityregions.

3.1.ReducedCost

TherearenumerouswaysinwhichTEKwilllowerthecostofInternetaccessfortheenduser. Insomeregions,email -onlyaccountsaremuchcheaperthanaccountsthatallowfullaccessto theWorldWideWeb(seeTable1).Thus,TEKwillmakeWebresource savailabletothosewho couldotherwiseaffordonlyemail.Inaddition,telephonelinesareoftenclearer,morestable, andcheapertouseduringoff -peakhours;TEKcanbesetuptorunduringthesetimes.

Location	ISP	UnlimitedEmail	15Hoursof	ExtraHoursof
			InternetAccess	InternetAccess
Malawi	EpsilonΩ	\$15/month	\$30/month	\$1.50/hour
SriLanka	LankaNet	\$11/month	\$15/month	\$1.32/hour(peak)
				\$0.88/hour(off -peak)

 Table 1: EmailandInternetratesas
 ofJuly2001.Sources:
 www.eomw.netand
 www.lankanet.org.

The TEK systemals odecreases costs by shortening the duration of each phone call to the ISP. First, the connection is shortened because the client machine spends all of its time eithers ending aquery or downloading results; unlike Webbrowsing, there is no idle time during which the user is reading pages or contemplating what to done xt. Second, when the results are being downloaded, all of the content is available on the ISP; the user does not have to wait for the ISP to fetch information from others ources. Third, the results them selves are more compact, since they are filtered and compressed on the server side.

RetrievalMethod HardDisk		Price \$250/75GB	PriceperMbyte \$0.00325	RelativeCostperMbyte 1.0
modem	10% utilization	\$1.75/hour	\$1.04	320.0
(SriLanka)	1%utilization		\$10.4	3200.0
128kbs	100%utilization	\$30/month	\$0.00074	0.23
Cable/DSL	10% utilizat ion	unlimitedaccess	\$0.0074	2.3
(USA)	1%utilization		\$0.074	23.0

 Table2:
 Estimatedcostsoflocalstoragevs.remotefetchasofJuly2001.

Finally, there will be further savings if some TEK searches can be eliminated altogether -which hutilityfindsthesoughtinformationintheclient'slocaldigital willhappenwhenthelocalsearc library.Toemphasizethatitisacost -effectivestrategyfortheclienttokeepapersistentcopyof eachpagethatitdownloadsfromtheserver,letusconsiderafewcalculations(se eTable2). Assumingthata75GBharddiskcosts\$250dollars,itfollowsthatonemegabyte(MB)ofhard diskspacecosts\$0.0032.Ontheotherhand,downloadingoneMBofdataovera28.8kbs modematarateof\$1.75perhourwouldcost\$0.104 -moret han32timesasmuchasstoring thedataondisk!Andthisfigureassumesaperfectutilizationofthemodem'sbandwidth;witha morerealisticutilizationbetween1% and 10%, retrieving pages over the phone becomes three ordersofmagnitudemore expensive ethanstoring the mondisk. Thus, even if there is only a 1% chancethatadownloadedpagewillbeneededagaininthefuture, it is economically advantageoustobuyaharddiskonwhichtostoredownloadedpages, rather than planning to downloadthema secondtime.Notethat, given the Internet prices in the United States, these resultsarereversed -i.e., there is not an economic incentive to support an extensive client -side digitallibrary.

3.2.ImprovedReliability

TEKimprovestherobustnessof Webaccessbyreducingtheuser'sdependenceontheISP's externalnetwork.Thatis,whentheuserwantstobrowsetheWebinreal -time,twoconnections needtobeworking:fromtheusertotheISP,andfromtheISPtotherestoftheworld. However,wi thanemail -basedprotocol,theseconnectionsaredecoupled.First,oversome periodoftime,thereneedstobeaworkingpathfromtheMITservertotheuser'sISP.Then,at someothertime,theuserneedstoconnecttotheISPanddownloadtheresults. Inotherwords, itispossibletoobtainapageusingTEKevenifthepageisconstantlyunavailabletoaWeb browserusingthesameISP.

Assuming that the client sends and receives TEK emails onceperday, the user can expect to find the results of a uery within 48 hours (since the query will be sent within 24 hours, and the results received within the next 24 hours). In cases where the email is delayed or lost enroute, the communication protocol automatically manages the retransmission procedures.

3.3.ImprovedConvenience

Atfirstglance, itmight appear that TEK is inconvenient because of the delay it imposes between searchingandreceivingtheresults.However,therearemanywaysinwhichusingTEKismore browserinalow -connectivityarea.Primarily,oncethe convenientthanusinganonlineWeb resultshavearrivedviaemail, one can browsethrough the mallin real -time,insteadofenduring theslow, unreliable, and frustrating process of loading each page when one is connected. Further, one can look at the results at any time that is convenient, and the results will remain availabletoallusersofthemachineaslongasthereisspaceontheharddrive. The results themselvesmightbemorerelevanttotheuser'squery, since the TEKser verspentmoretime analyzing and processing the results than conventional, speed-optimizedsearchengines.Finally, TEK'snighttimedownloadfeaturecouldfreeupone'sphonelineforotherusesduringdaylight hours, as well as avoiding phoneline conge stionintryingtoconnecttotheISPduringpeak hours.

4.RelatedWork

ThereareanumberofsearchenginesthathavesomethingincommonwithTEK.Google eliminatespagesthatareverysimilar;NorthernLightandVivisimoperformclusteringofpages, andMetaCrawlerinvokesmultiplesearchenginestoperformthesearch.However,allofthese searchenginesareoptimizedforspeed.TEKisfundamentallydifferentinthatitisoptimizedfor low-bandwidthandlow -connectivity.

Orthogonally,therearea numberofemail -basedservicesthatreturntextrepresentationsofa givenwebpage,withsomethatprovideaninterfacetosearchengines(e.g.,GetWeb, www4mail,Web ²Mail).Theseservices,however,returnonlythepagelistingthesearchresults, insteadofdownloadingthediscoveredpagesandpassingonthemostusefulonestotheclient. Moreover,theylacktwoofTEK'skeyfeatures:1)aserverthatrecordswhichpagesarealready ontheclient,therebyeliminatingredundantclient/servercommunicat ion,and2)aseriesof specializedinformationretrievaltechniquesthatfilter,analyze,andcompresstheresultsonthe serverbeforesendingthemtotheclient.

5. DiscussionandFutureWork

The TEK search engine is initiancy. There are many questions that we will not be able to further research until the system is deployed and we can gather us agest at istics. How broad is each location's knowledgeneeds? How much repetition and overlap is there among queries? What information should initially be included in the local library on the client machine? How do information needs differind ifferent cultures? While fascinating, the sequestions must all wait. We have designed the TEK system to be flexible, such that the specific information retrieval techniques item ploys can be adjusted depending on observed us age patterns.

However, there are several enhancements that could be made now to the basic system. Because it could take up to two days for the server to notify the client that a query is bad y formed, it will be valuable to provide a more sophistic at edguery builder on the client to help ensure that a query is appropriate — for instance, by detecting spelling errors or estimating the number of pages that would match the given terms.

On these rverside, an umber of techniques could be explored to improve the quality of the search results. These archerms could be augmented with category information that will direct the search engines to search as ubset of the Web. Similarly, the user could provide a document that is similar informatto the one that she is seeking, but on a different subject — for example, she might send are ference to aguide on growing cornwhenshe is seeking aguide to growing rice. In addition, a mechanism togather fee dback from the users of TEK on the useful ness of each returned page will be critical for evaluating the effectiveness of the heuristics employed by the server. The server could even use this information on a client - by-client basis to choose the search met hodologies that are best suited to agive nuser. Finally, we will have to expand TEK to support other languages.

6. Conclusions

TEKisatechnicalsolutiontoasocialneed.Fromitsconception,TEKwasbasedonan understandingoftheculturalcontexti tneedstoserve.Whilecutting -edgeInformation Technologytendstowards"moreinformation,faster,"TEKisdesignedtoworkinalow connectivity,low -bandwidthsetting,wheretheaimistoguaranteethedeliveryof"better information,slower."

Wedo notconsiderTEKtobeapermanentsolutiontotheproblemofprovidingInternetaccess indevelopingcountries.Instead,webelievethatthereisaneedforaninterimsolution –amore reasonablewayforpeopletoaccesstheInternet –whilemoreambiti ousandlong -term telecommunicationinitiativesareimplemented.Byitsgainsinaffordability,reliability,and convenience,webelievethatTEKwillmeetexactlythatneed:itwillbringWebaccesstosome peoplewhowouldotherwisebewithoutit.

7.Acknowledgements

The TEK system has been designed and developed with the help of the following students: Alexandro Artola, Sheldon Chan, Genevieve T. Cuevas, Mark Halsey, Sid Henderson, Yuliya Litvak, Tazeen Mahtab, Janelle Prevost, Saad Shakhshirand Binh D. Vo. We have had advice and discussions with: David Clark, Michael Dertouzos, David Karger, Jaime Teevan, Lynn Andrea Stein, and Peter Szolovits. Thankyou.
