Writing Sparse Code is Hard

Writing Sparse Code is Hard

Input Sparse Matrix $A_{i,j}$

(Matrix-Vector Multiply)
Tensor Expression Language
 $y_i = A_{i,j} * x_j$
Format of $A_{i,j} = \text{COO}$
Scheduling Language

```
int32_t iA = A1_pos[0];  
int32_t pA1_end = A1_pos[1];  
while (iA < pA1_end) {  
    int32_t i = A1_crd[iA];  
    int32_t A1_segend = iA + 1;  
    while (A1_segend < pA1_end &&  
           A1_crd[A1_segend] == i){  
        ...  
    }  
}
```

 Runtime : 10ms

Writing Sparse Code is Hard

(Matrix-Vector Multiply)
 $y_i = A_{i,j} * x_j$
Format of $A_{i,j} = \text{CSR}$
Scheduling Language

```
for (int32_t i = 0;
      i < A1_dimension;
      i++){
  for (int32_t jA=A2_pos[i];
        jA<A2_pos[i+1];
        jA++){
    int32_t j = A2_crd[jA];
    ...
  }
}
```

 Runtime : 3ms

Writing Sparse Code is Hard

(Matrix-Vector Multiply)

$$y_i = A_{i,j} * x_j$$

Format of $A_{i,j} = CSR$

```
.split(i,i0,i1,32)  
.reorder(i0,i1,j)  
.parallelize(i0)
```

```
#pragma omp parallel for  
for (int32_t i0=0;  
     i0<(A1_dimension/32); i0++)  
{  
  for (int32_t i1=0; i1<32; i1++)  
  {  
    int32_t i = i0*32 + i1;  
  
    ...  
  }  
}
```

 Runtime : 1ms

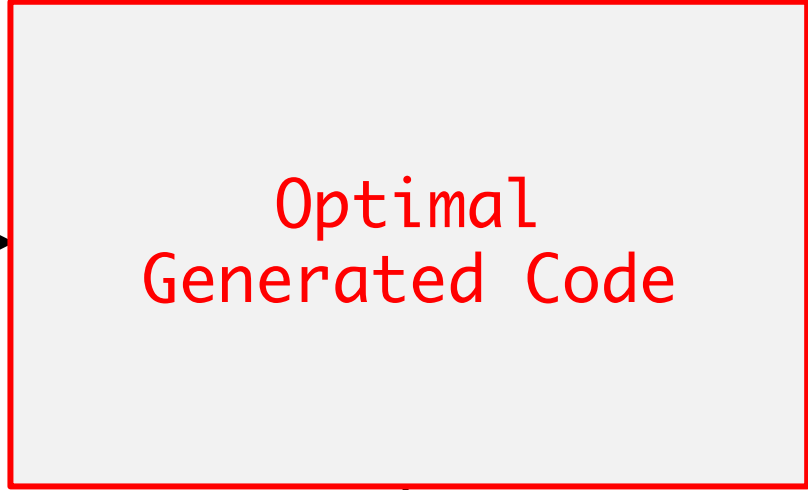

Writing **Fast** Sparse Code is Hard!

(Matrix-Vector Multiply)

$$y_i = A_{i,j} * x_j$$

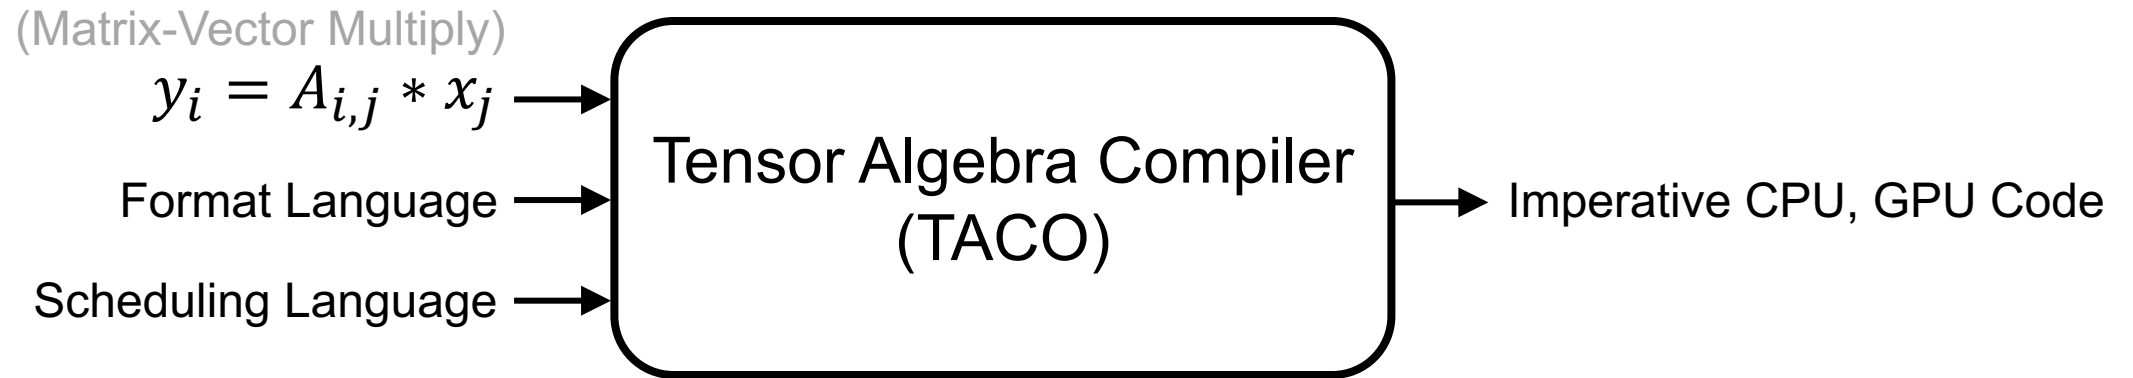

Format : ???
Schedule : ???

Fastest Runtime

What would be the optimal format and schedule?

Writing Sparse Code is Hard

Writing Fast Tensor Program is Hard!

Dense Matrix

Optimal Loop Transformation

(Optimal Scheduling Language)

```
.split(i,i1,i0,256)
.split(k,k1,k0,256)
.split(j,j1,j0,16)
.reorder(i1,k1,j1,i0,k0,j0)
.unroll(k0,4)
.vectorize(i0)
.parallelize(i1)
```

```
.split(i,i1,i0,64)
.reorder(i1,k,i0)
.parallelize(i1)
```

```
.split(i,i1,i0,64)
.split(k,k1,k0,16)
.reorder(k1,i1,i0,k0)
.parallelize(i1)
```

Optimization
depends on
tensor's shape

Writing Fast **Sparse** Tensor Program is **Even Harder!**

Sparse Matrix

Optimal Loop Transformation

```
.split(i,i1,i0,256)
.split(k,k1,k0,256)
.split(j,j1,j0,16)
.reorder(i1,k1,j1,i0,k0,j0)
.unroll(k0,4)
.vectorize(i0)
.parallelize(i1)
```

```
.split(i,i1,i0,64)
.reorder(i1,k,i0)
.parallelize(i1)
```

```
.split(i,i1,i0,64)
.split(k,k1,k0,16)
.reorder(k1,i1,i0,k0)
.parallelize(i1)
```

Evaluation

- CPU: Intel Xeon E5-2680 v3
- Data: 975 Real-World Sparse Matrices

Kernels	Auto-tuner		Hand-Written	
	Format-only	Schedule-only	TACO w/ Expert	ASpT
SpMV	1.43x	2.32x	1.54x	-
SpMM	1.18x	1.68x	1.26x	1.36x
SDDMM	-	-	1.29x	1.14x
MTTKRP	1.27x	-	1.35x	-

1. Outperforms **all baselines** on **all kernels** on average
2. Shows good result on **3D sparsity pattern** (MTTKRP)

WACO : Summary

1. Search space considering both format and schedule.

- Explore space with Nearest Neighbor Search.

2. WACONet with submanifold sparse convolution.

- Avoid downsampling.
- More stride layers identifies distant non-zeros.

Key takeaways

1. Auto-tuning pays the cost

- 1000(100) runs needed in SpMV(SpMM) to amortize.

2. Load-balancing is crucial

- Over 50% of matrices had improved performance with better load-balancing.

3. Increasing sparsity in dense block format can be helpful!

Key takeaways

1. Auto-tuning pays the cost

- 1000(100) runs needed in SpMV(SpMM) to amortize.

2. Load-balancing is crucial

- Over 50% of matrices had improved performance with better load-balancing.

3. Increasing sparsity in dense block format can be helpful!

Future Direction

1. Auto-tuning pays the cost

- 1000(100) runs needed in SpMV(SpMM) to amortize.

2. Load-balancing is crucial

- Over 50% of matrices had improved performance with better load-balancing.

3. Increasing sparsity in dense block format can be helpful!

Thank you!
