

Teaching Strategy Documentation

Shioulin Sam

July 25, 2003

Instructions on running the program

1. cd into `/project/intelligent-book/teaching-strategy`
2. Load the mechanics system by typing *mechanics* at the prompt. This will bring up an edwin window. Mechanics system is in `/usr/local/bin`.
3. Type (*load "load-teacher"*). This will load the tms and electric directory together with other circuit independent files.
4. Type (*load "main"*) to launch the program. Prior to starting the program, this file also loads all circuit specific files and definitions. Using a different circuit will require modifications to this file. A new circuit definition file has to be loaded, along with modifications to the `constraint-1st`, `heuristics-1st` and interesting variables.
